Web-based Operational Task Status Boards

Battelle #: 13542-E

Copyright Granted

Web-based Operational Status Boards (WebOSB™) is a software product that allows an emergency operations center (EOC) to support operational status boards in a web-based environment. Status information is updated and displayed in a constant, dynamic fashion for all users via the Internet. Status board definitions and data are stored in a standard relational database making it easy for users to implement the system in conjunction with software they may already own. WebOSB allows any EOC, or other decision-making body, to display, track and share real-time operational status information between multiple users and/or locations. New status boards can be quickly defined and implemented by a local administrator. Existing boards can be modified in minutes to add new items without losing existing information. Access to edit and/or view status boards is granted on an individual user basis by the local administrator. Status boards can be used on a continuing basis or created for monitoring short-term situations.
