Mozart™  
13489-E  
Patent Pending

A Windows-based software application for the automated assessment of Internet information related to a web domain or topic. Internet page information is methodically discovered, harvested, and analyzed according to user specified parameters. Mozart features an intuitive application based control console.

Mozart allows two different approaches: programmatic (topical) or facility (web domain). In the programmatic or topical approach, web pages concerning the target topic are collected from the entire Internet and Newsgroup domain for analysis. In the facility or web domain approach, a target domain, web site, or set of web locations are chosen and all information within the target domain, web site, or set of web locations is collected for analysis.
